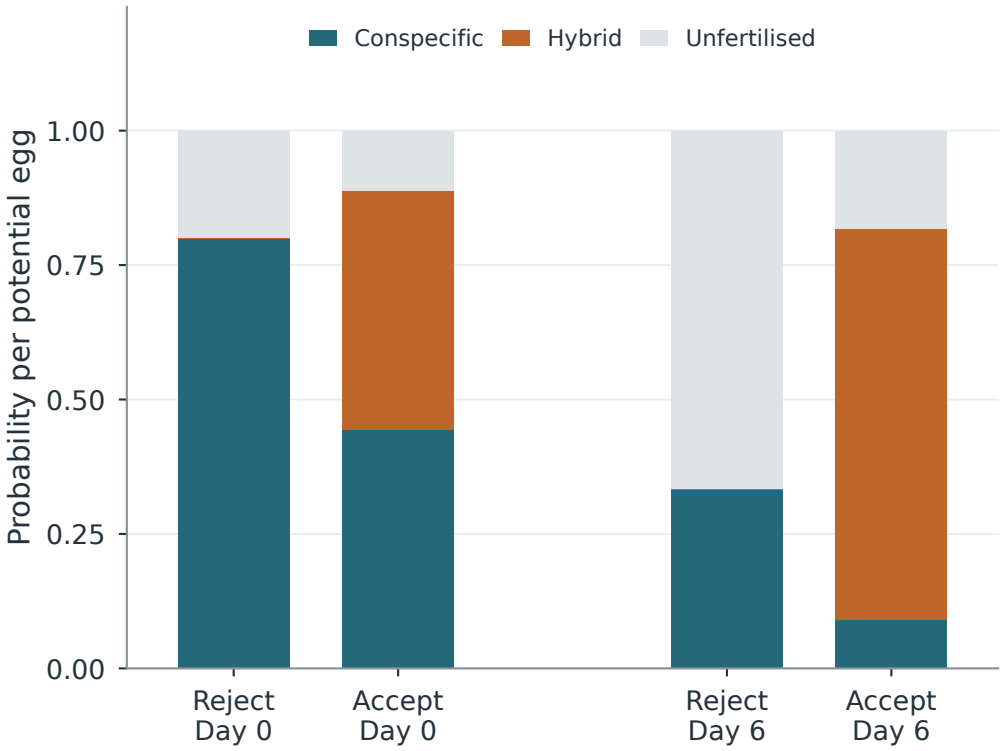
2 Remating can help after the conspecific store declines

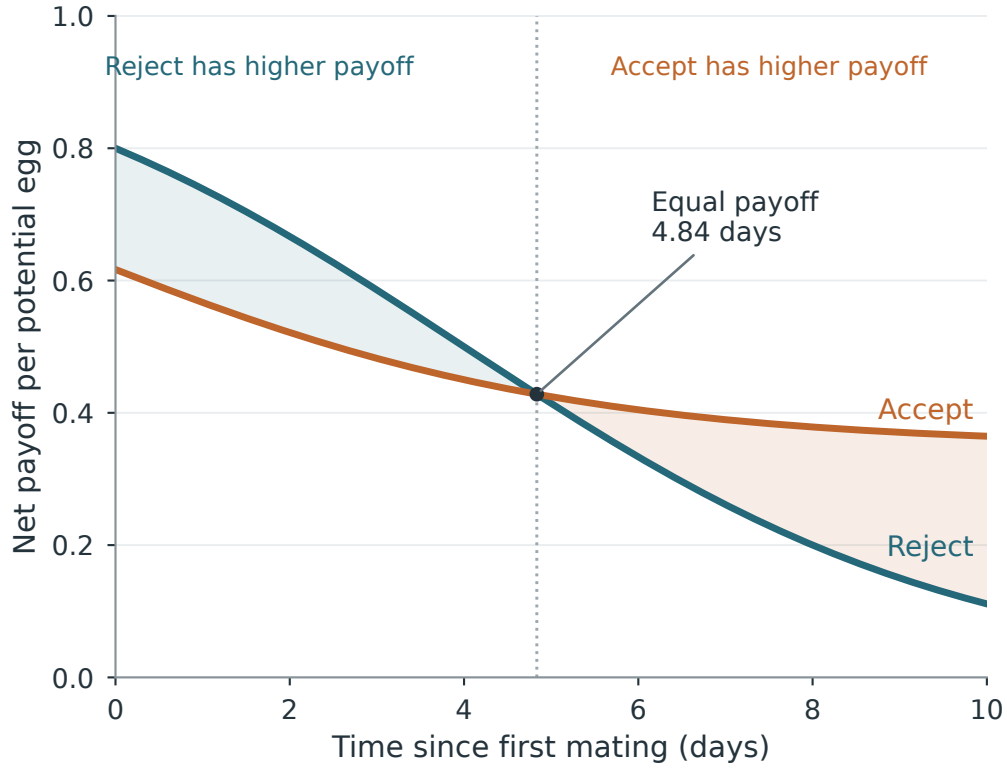
New sperm can reduce fertilisation failure while also replacing conspecific fertilisations with hybrid fertilisations.

$$W_{\text{reject}} = \frac{x}{1+x} \quad ; \quad W_{\text{accept}} = \frac{x+wy}{1+x+y} - c$$

A Fertilisation outcomes before fitness weighting



B Net payoff after offspring fitness and cost



Illustrative values: $x_0 = 4$, $h_C = 2$ days, $y = 4$, $w = 0.5$, $c = 0.05$. Sperm amounts are scaled units.
